

Warehouse Management

Monitor and Optimize Logistical Operations

Logistics and warehouse managers have a difficult job. Given the constant movement of goods and the consistent inbound and outbound deliveries that take place, you need an end-to-end solution that promotes both efficiency and accuracy. Our ERP solutions are made to give your warehouse managers the tools they need to effectively pursue this goal.

We considered warehouse operations from every angle when we designed our solution. You need a holistic view of your shipping operations and the ability to drill down into detailed inventory data, but still actually operationalize shipments using physical labels, SSCC and license plating. Our ERP solutions seamlessly connect every piece of the shipment process in one place. From the utilization of barcode scanners to allowing for the definition of acceptable deliveries, our solution brings a wide range of functionality to your warehouse management.

Benefits

- » Use handheld barcode scanners that transmit data directly into the ERP system, in real-time
- » View your inventory across all locations with detailed information per item, bin and lot
- » Inbound and outbound activities are shown on a single screen with the ability to sort
- » Color-coded logistical status settings
- » Track delivery quantity deviations from your vendors and notify employees of violations
- » Create separate mobile profiles for workers to assign different activities by functional area
- » Configure specific SSCC requirements on a customer or company level
- » Easily generate labels or barcodes using virtually any data and print them out

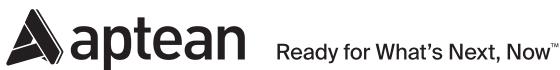

We've created a warehouse and inbound/outbound shipment management system that works specifically within our ERP solutions. We recognize that the movement of inventory from point A to point B isn't a simple process; our system combines an array of functionalities to make it both dynamic and easy-to-use.

- › **Replace Paper-Based Systems** – Use handheld barcode scanners to record and transmit data directly into the ERP system, giving you real-time information.
- › **Leverage Better Planning Tools** – Be more precise in your planning by defining logistical time settings per customer, ship-to address, vendor, order address and transfer route.
- › **Use Comprehensive Dashboards** – All incoming and outgoing logistical activities are sorted by logistical date/time where you can create, edit and post related warehouse records.
- › **Manage Your Packaging Inventory** – Create a default packaging designation and register the crates and pallets used in your logistics process.
- › **Track Your Vendors' Performance** – Track ordered versus received quantities from your vendors and calculate each vendor's delivery accuracy.
- › **Customer-Specific SSCC Requirements** – Define SSCC codes on a customer or company level and alert employees with a notification if a requirement is not met during the pre-shipment process.
- › **Visualize Your Operations** – Use a comprehensive transport planning screen to ensure your operations run as smoothly as possible.
- › **Create Labels With Specific Data** – Identify which tables in Microsoft Dynamics 365 Business Central form the basis of a given label, set relationships between these tables, select which table fields should be used, and use filtering to ensure that specific field values are included; then print them out.
